## Abstracts

The global Graphene Current Collector market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The current collector graphene is composed of multiple layers of graphene sheets, which are stacked or arranged in a specific way to form an overall structure with fluid properties. The overall fluid state makes the current collector graphene have certain flexibility and plasticity in the preparation and application process. The current collector graphene has ultra-high electrical conductivity and can effectively improve the performance indicators of electronic components. In addition to conductivity, the current collector graphene also exhibits good thermal conductivity, which helps the transfer and heat dissipation of thermal energy. Therefore, the current collector graphene has broad application prospects in the fields of electronic components, solar cells, etc. In terms of electronic components, it can be used to prepare efficient conductive copper foil and improve the conductivity of capacitors, electrode materials, etc. In the field of solar cells, it can be used as a conductive adhesive to improve the conversion efficiency of solar cells.

United States market for Graphene Current Collector is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Graphene Current Collector is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
