The global Graphene Health Wearable Product market size is predicted to grow from US\$ 503 million in 2025 to US\$ 727 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

Graphene is a two-dimensional carbon nanomaterial composed of carbon atoms in a hexagonal honeycomb lattice with sp^2 hybrid orbitals. It has many advantages in being used in clothing fabrics. Graphene material is peeled off from graphite and is the material with the highest thermal conductivity so far. It has very good thermal conductivity. When current passes through, graphene can emit far infrared rays, which can be absorbed by the human body and resonate, making people feel warm from the inside out. Graphene materials are made into warm fabrics and heating functional fabrics and worn on the body. Compared with traditional heating materials, ordinary heating materials are heated by themselves and make the human body feel warm by direct contact with the heating surface, while graphene is a far-infrared resonance with the human body to achieve heat energy circulation, so that the human body heats itself, the warming effect is more lasting, the wearing experience is more comfortable, and the material is healthier to use. The flexibility and strength of graphene make it an ideal material for manufacturing wearable devices. It can be combined with various flexible substrate materials to create smart clothing that is both durable and comfortable. This kind of clothing can not only adapt to the wearer's body movements, but also provide additional functions in daily activities, such as energy storage and conversion. The research scope of this report includes graphene clothing, graphene functional protective gear, etc.
