The global Graphite Degassing Tube market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

A graphite degassing tube is a cylindrical tube made of graphite material that is used in various industries for degassing or removing gases from molten metals during casting or other metallurgical processes. It is designed to withstand high temperatures and corrosive environments while efficiently eliminating gases such as hydrogen, oxygen, nitrogen, and other impurities present in the molten metal.

Graphite degassing tubes play a crucial role in the metal casting process by effectively removing unwanted gases and impurities from the molten metal. Their use helps enhance the mechanical properties, surface finish, and overall quality of castings, ensuring the production of high-quality and reliable metal components.
