The global Graphite Felt for Flow Battery market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

A flow battery is a battery that generates electricity by transporting electrolytes between electrodes and a core reactant. Graphite felt is a non-metallic material made of high-purity natural or artificial graphite fibers, which has good electrical conductivity, high temperature resistance, and corrosion resistance. Graphite felt for flow batteries is mainly used as an electrode material, usually placed on the positive or negative electrode of the battery reactor. Graphite felt for flow batteries has high conductivity and good corrosion resistance to meet the requirements of battery reactive substances and the environment for electrode materials.

The main function of graphite felt for flow batteries is to provide large-area contact, ensure operational stability, and increase service life. It should be noted that the graphite felt used in the flow battery needs to have high conductivity and good corrosion resistance. During use, the graphite felt needs to be maintained and replaced regularly to ensure the long-term stable operation of the battery.
