The global Graphite Quench Tower market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

Quench towers made of impermeable graphite are usually used for rapid cooling of high-temperature gases (corrosive flue gas, chlorine-containing waste liquid incineration gas). The graphite quench tower has the characteristics of simple structure, convenient manufacture, large pressure drop, strong adaptability, and large processing capacity.

The principle of rapid cooling: 1. The vaporization of the spray liquid takes away the heat; 2. The heat transfer of the graphite partition wall takes away the heat; 3. The temperature of the spray liquid is lower than the gas temperature, and the heat is exchanged with each other. in operation. The direction of gas and liquid flow is generally countercurrent. The liquid is evenly sprinkled down from the top of the tower through the spraying device, and the gas is evenly risen from the bottom of the tower. The gas-liquid two-phase contacts with each other through the surface of the packing, so as to transfer heat and mass.
