The global Graphitized Recarburizer for Casting market size is predicted to grow from US$ 183 million in 2025 to US$ 247 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Graphitized recarburizer for casting is a high carbon material that has undergone high-temperature graphitization treatment (usually at 2500-3000 ° C). It is mainly used in the melting process of cast iron (such as ductile iron and gray cast iron) to increase the carbon content in the molten iron and improve the microstructure and properties of cast iron. In 2024, global Graphitized Recarburizer for Casting production reached approximately 306 K MT, with an average global market price of around US$ 585 per MT.The annual production capacity of a single production line is usually between 3000-8000 tons.The gross profit margin is usually around 25%.

Main raw materials: The most common raw material is petroleum coke, followed by asphalt coke. These raw materials are first calcined to remove volatile components, and then subjected to graphitization treatment in a high-temperature graphitization furnace.

Application areas: Used for producing various types of ductile iron and gray iron parts such as engine cylinder blocks, cylinder heads, brake discs, cast pipes, etc.
