Abstracts

The global Graphitized Recarburizer for Steelmaking Ironmaking market size is predicted to grow from US$ 280 million in 2025 to US$ 378 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Graphitized recarburizer is a carbonaceous material that has undergone high-temperature heat treatment (graphitization). It is mainly used to increase the carbon content in molten iron or steel during the steel smelting process, promote the precipitation of carbon in graphite form, and improve product performance. In 2024, global Graphitized Recarburizer for Steelmaking Ironmaking production reached approximately 468 K MT, with an average global market price of around US$ 585 per MT. The annual production capacity of a single production line is 1000-2000 tons/year (for a single furnace). The gross profit margin is usually between 15% and 30%.

Upstream is the petrochemical and coal chemical industries.

Core raw materials:

Calcined petroleum coke: the most mainstream and high-quality raw material. It is the product of petroleum coke calcined at 1300 ?, which has already removed moisture and volatile matter.

Asphalt coke: Another important raw material with properties similar to petroleum coke.

Anthracite: can be used to produce low-end carburizers, but is less commonly used in the production of graphitized carburizers.
