The global Grating-Coupled Interferometry (GCI) market size is predicted to grow from US\$ 90.9 million in 2025 to US\$ 159 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

Grating-Coupled Interferometry (GCI) is a recently developed chip-based non-labelled biosensor technology with high sensitivity. It differs from traditional molecular interaction techniques that rely on fluorescence and immunological labels by combining high signal-to-noise ratio, high temporal resolution, and compatibility with crude samples, thus breaking through the research impasse of molecular interactions. Through GCI technology, a complete set of information describing molecular interactions can be obtained quickly, accurately, and reliably, including the presence or absence of binding, the specificity of binding, the affinity that describes the strength of binding, and the kinetic constants that describe the speed and stability of binding.

United States market for Grating-Coupled Interferometry (GCI) is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
