The global Grating Indicator Calibrator market size is predicted to grow from US$ 390 million in 2025 to US$ 545 million in 2031; it is expected to grow at a CAGR of 5.7% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The grating indicator calibrator is a high-precision measuring device, mainly used to calibrate various indicators, such as dial indicators, micrometers, lever indicators, bore indicators, etc. The instrument uses photoelectric, mechanical and electronic technology and precise grating technology to semi-automatically or fully automatically calibrate various indicators according to national calibration regulations. Its working principle is based on the grating displacement measurement system. The motor drives the grating displacement, automatically collects data, measures the indication error and return error, and finally generates a calibration report.

At present, there are many models of grating indicator calibrators on the market, and the prices vary depending on the functions and accuracy requirements. For example, the SJ2019 high-speed indicator automatic calibrator has a measurement range of 0-50mm, a resolution of 0.1?m, an indication error of ?1.0?m for any 2mm error, ?1.3?m for any 10mm error, ?1.5?m for any 30mm error, ?2.0?m for the entire range, and ?0.5?m for the return range. It is suitable for calibrating indicator meters, lever meters, bore meters and other indicator meters of various specifications. The price of this instrument varies in the market, and the specific price needs to be consulted according to the supplier and configuration.
