Gravel flame arrester is a safety device used to prevent the outward spread of hydrogen flame. It is composed of a solid material (fire retardant element) with many small channels or gaps that can pass through gas. It is required that the gap or channel of the flame arrester element should be as small as possible. Therefore, when the flame enters the flame arrester, it is divided into many small flame flows by the flame arrester element. Due to heat transfer (gas is cooled) and wall effect, the flame flow is quenched
