Gravity drop corer is a specialized scientific instrument used for collecting sediment samples from the ocean floor or other bodies of water. The corer is typically composed of a heavy metal weight and a sampling tube. The corer is lowered from a research vessel or platform to the seafloor, where the weight propels the tube into the sediment. The weight drops freely within the corer, providing the necessary force to penetrate the sediment layers. Once the corer has reached a sufficient depth, it is retrieved, bringing the sediment sample back to the surface for analysis. The gravity drop corer is commonly used in environmental and geological studies to study sediment composition, dating, and paleoclimate research.
