The global Gravity Energy Storage Systems market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

A gravity battery is a type of energy storage device that stores gravitational energy, the energy stored in an object resulting from a change in height due to gravity, also called potential energy. A gravity battery works by using excess energy from the grid to raise a mass to generate gravitational potential energy, which is then dropped to convert potential energy into electricity through an electric generator. Energy generated from a gravity battery is a form of sustainable energy. One form of a gravity battery is one that lowers a mass, such as a block of concrete, to generate electricity.

At present, Energy Vault's standard 35MWH gravity energy storage system is mainly used in this market, but in fact products of 1-80MWH can be produced. Specific specifications will appear in more varieties in the next few years with different usage requirements. The main manufacturers of Gravity energy storage systems are Energy Vault, Heindl Energy, Advanced Rail, Energy Storage and Gravitricity. These systems are very suitable for large-scale energy storage such as public utilities, especially suitable for more remote areas. According to statistics, 45% of the world's land can be built with this kind of energy storage system. And because of the use of building materials such as concrete as raw materials, it has the conditions for sustainable development and has a longer energy storage life than chemical batteries.
