The global Green Renewable Energy market size is predicted to grow from US\$ 608804 million in 2025 to US\$ 952012 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Green Renewable Energy, under the scope of this report, refers to renewable power generation and project development activities that convert naturally replenished resources such as solar energy, wind energy, hydropower, geothermal energy, biomass energy and selected marine energy into commercially supplied electricity. The scope focuses on companies and platforms that develop, finance, own, operate or control renewable power assets and generate recurring revenue through grid-connected electricity sales, regulated tariffs, corporate power purchase agreements, merchant power markets and green power procurement mechanisms. Typical asset forms include utility-scale solar power plants, distributed solar portfolios, onshore wind farms, offshore wind farms, hydropower plants, geothermal power plants, biomass and waste-to-energy power projects, as well as hybrid renewable configurations such as wind-solar, hydro-solar and renewable-plus-storage power assets. The core industrial value of green renewable energy lies in transforming renewable natural resources into dispatchable, contractable and monetizable low-carbon electricity supply, while supporting power system decarbonization, energy security and long-term electrification demand.

Based on our research, Green Renewable Energy has evolved from a policy-supported energy transition segment into a core infrastructure category for global power system expansion. Under the scope of renewable power generation and project development, the industry is not primarily defined by equipment manufacturing or engineering contracting, but by the development, ownership, operation and commercialization of renewable power assets. Its revenue base is built on grid-connected electricity sales,

regulated tariffs, long-term PPAs, merchant power exposure and green electricity procurement. Global renewable power capacity reached approximately 5,149 GW by the end of 2025, with about 692 GW added during the year, confirming that the sector remains in a high-growth infrastructure cycle. The International Energy Agency expects global renewable power capacity to increase by around 4,600 GW by 2030, which indicates that green renewable energy is now supported by a broad set of drivers, including energy security, electrification, corporate decarbonization and long-term power demand growth. From a product and technology perspective, the industry is becoming more diversified in structure but more concentrated in incremental growth. Solar PV is the strongest driver of new capacity because of its modular deployment model, relatively short construction cycle, declining system cost and suitability for both utility-scale and distributed applications. Onshore wind remains competitive in high-quality wind-resource regions, while offshore wind offers large-scale generation potential near coastal load centers but requires stronger balance sheets, more complex permitting, specialized supply chains and grid coordination. Hydropower, geothermal power and biomass power have more resource-constrained growth profiles, yet they remain strategically important because they can provide more stable output, system flexibility or region-specific baseload renewable power. As penetration rises, the competitive focus is shifting from simply adding capacity to managing grid access, curtailment risk, dispatch value, power price exposure and long-term contract quality. From a competitive structure perspective, Green Renewable Energy is a layered global industry rather than a winner-takes-all market. Large integrated utilities and national power groups dominate in capital-intensive utility-scale portfolios, cross-regional project development and regulated power systems. Independent power producers and renewable asset platforms are stronger in PPA-driven markets, corporate procurement and asset recycling models. Regional developers and specialist operators compete through local permitting capabilities, resource access, government relationships and technical depth in specific routes such as geothermal, offshore wind or distributed solar. China has become one of the most important global markets and supply-side anchors: official data show that China added more than 430 GW of new wind and solar capacity in 2025, while renewable power generation reached about 4 trillion kWh. This scale supports a large domestic ecosystem of state-owned power groups, listed renewable platforms and regional project operators. From a policy and forward-looking perspective, the next phase of growth will be shaped by the interaction between climate targets, energy security priorities, grid investment and market-based power pricing. The COP28 Global Renewables and Energy Efficiency Pledge set an ambition to triple global installed renewable generation capacity to at least 11,000 GW by 2030, while the revised EU Renewable Energy Directive sets a binding 2030 renewable energy target of at least 42.5% and aims for 45%. These targets provide a strong policy anchor for

renewable project development, corporate PPAs, green power procurement and grid-related capital expenditure. However, the industry's future returns will depend increasingly on execution quality rather than headline capacity additions. Curtailment, negative pricing, interest rates, supply-chain inflation, permitting delays and grid congestion can all weaken project economics. Companies with low-cost capital, diversified renewable portfolios, strong power trading capabilities, storage integration strategies and high-quality offtake contracts are likely to be better positioned as renewable penetration rises across major power markets.
