The greenhouse shading system is an important agricultural facility. It mainly uses materials with a certain light transmittance to block part of the excess light, which not only ensures the light required for the normal growth of crops in the greenhouse, but also prevents excess solar radiation from emitting in the greenhouse. Internal accumulation leads to excessive indoor temperature. This can effectively adjust the light and temperature conditions inside the greenhouse and provide a suitable growing environment for crops.

The global Greenhouse Shading System market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
