Grey and brown methanol refer to methanol produced from different sources or processes, with the distinction often relating to the carbon footprint or environmental impact associated with their production.

Grey methanol is typically produced from fossil fuels, such as natural gas or coal, without capturing or offsetting the carbon dioxide (CO₂) emissions generated during the production process. This is the most common method for producing methanol and is widely used across the globe due to the availability and economic feasibility of fossil fuel resources. However, the environmental impact, including the release of a significant amount of CO₂ and other greenhouse gases, is a major concern.

Brown methanol could refer to methanol produced specifically from coal through a process known as coal gasification. Coal gasification involves converting coal into syngas (a mixture of hydrogen, carbon monoxide, and CO₂) and then synthesizing the syngas into methanol. This process is more carbon-intensive than producing methanol from natural gas, thus making brown methanol even less environmentally friendly due to higher CO₂ emissions and other pollutants associated with coal extraction and processing.

The global Grey and Brown Methanol market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
