The global Grinding Ball market size is predicted to grow from US\$ 2184 million in 2025 to US\$ 3352 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Global grinding ball sales reached 2.7 million tons in 2025, with an average price of \$812 per ton.

Grinding balls are used to grind materials into fine powders. It is used to mix materials such as chemicals, paints, ceramics, and ores. The grinding balls made from different materials (stainless steel and ceramics) may be used for the same application.

The raw materials for grinding balls fall into two main categories: ?metallic? and ?non-metallic.? Metallic grinding balls primarily use scrap steel, high-carbon round steel, or pig iron, with alloying elements such as ferrochrome and ferromanganese added to adjust the composition. After electric furnace smelting, they are cast into high-chromium/medium-chromium/low-chromium cast iron balls, or hot-rolled/forged into steel balls such as 45#, 60Mn, and B2. Non-metallic grinding balls use ceramic powders such as alumina, zirconium oxide, and silicon nitride, formed through isostatic pressing and high-temperature sintering, and are used for grinding high-purity materials.

Cost structure: Scrap steel/pig iron and alloy additives account for 55-60% of the cost of metallic grinding balls; electricity and heat treatment energy consumption account for 15%; roll/mold wear and equipment depreciation account for 10%; labor and manufacturing costs account for 10%; packaging, transportation, and profit account for 5-10%. Based on 2025 market conditions, the raw material cost for high-chromium grinding balls, ceramic balls, can reach over 70% due to the high price of the powder.
