It is used to finish the surfaces of metal, plastic, and composite materials to improve flatness, smoothness, and assembly accuracy. Its core system typically includes a grinding spindle, motor drive, a sanding belt or wheel assembly, a pressure control module, and an automatic feeding mechanism. Upstream suppliers primarily include abrasive (such as alumina, silicon carbide, and diamond abrasives), sanding belts, grinding wheels, motors, and control systems. Downstream applications are concentrated in industries such as automotive parts, aerospace, precision machining, electronic casings, medical devices, and mold manufacturing. This equipment significantly reduces the labor intensity and error rate of manual deburring through automation and digital control, improving production efficiency and surface consistency, making it an indispensable finishing equipment in modern manufacturing.
