Generative Adversarial Networks (GANs) are a class of machine learning models that consist of two neural networks, known as the generator and the discriminator, which are trained simultaneously through adversarial training. During the training process, the generator and discriminator networks are locked in a competitive game. The generator aims to produce increasingly realistic data to deceive the discriminator, while the discriminator strives to improve its ability to accurately differentiate between real and fake data. This adversarial relationship drives both networks to improve over time.

The global Generative Adversarial Networks (GANs) market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
