The global Ground Effect Craft market size is predicted to grow from US\$ 3.59 million in 2025 to US\$ 12.63 million in 2032; it is expected to grow at a CAGR of 20.1% from 2026 to 2032.

Ground Effect Craft is a high-speed vehicle that glides over the water surface at close range using the principle of ground effect. It has the characteristics of both ships and aircraft. When its flying altitude is close to the water surface, the air under the wing is compressed to form a cushion lift, which gives it greater lift and less resistance, thereby achieving high-speed and low-energy operation. Wing-in-ground-effect craft are widely used in military patrols, emergency transportation, island supply and other scenarios, with advantages such as high speed, long range and strong passability.

The global ground effect craft market is welcoming a new wave of attention. As an innovative means of transportation that integrates aviation and ship technologies, the ground effect craft uses the principle of ground effect to glide at low altitude and high speed on the water surface. It has high efficiency, low fuel consumption and strong passability, and will become an important supplement to future water and land border transportation.

The core factors driving the development of the market mainly include: First, the demand for regional transportation modernization has increased, especially in countries and regions with many islands or dense water networks, such as Southeast Asia, the Middle East, and the Russian Far East. Ground effect craft can be used as an efficient tool for short-distance high-speed commuting or military and police patrols; second, driven by the green and low-carbon trend, its excellent fuel efficiency and low emission characteristics have received more policy support; third, the demand for fast and low-detectable platforms in the military and emergency fields has increased, promoting the exploration of the application of ground effect craft in special purposes. In addition, with

the maturity of composite material technology and lightweight propulsion systems, the performance and safety of the entire ship are also continuously improving.

However, the market also faces certain challenges and unfavorable factors. First, the global ground effect craft has not yet formed a large-scale commercial ecosystem, and the technical threshold and certification system are not unified, resulting in high entry costs; second, the traditional shipping and aviation regulatory framework has not yet fully covered this type of new tool, and policy ambiguity has constrained commercial operations; third, the manufacturing cost and maintenance system have not yet been fully scaled up, which restricts the economic promotion of the product. In addition, the end customer's awareness of its operation and safety still needs market cultivation.

The future development trend will focus on the modular production and intelligent upgrading of small and medium-sized ground effect craft, focusing on island transportation, maritime law enforcement, tourism, border patrol and other market segments; at the same time, international standard setting and military-civilian integration projects will accelerate its transition from "technical verification" to "industrial maturity".

Overall, the ground effect craft market is at a critical stage from technology incubation to application expansion, with huge medium- and long-term development potential, and deserves continued attention and investment from all parties in the industry chain.
