Ground Fault Current Protection Devices are electrical safety devices designed to protect people and equipment from electric shock or fire caused by ground faults—unintended electrical paths between a power source and a grounded surface. These devices monitor the current flowing in a circuit and quickly disconnect power when they detect a difference between the incoming and outgoing current, typically as small as 4–6 milliamps, which may indicate current leakage to ground. Widely used in residential, commercial, and industrial settings—especially in wet or hazardous environments—GFCIs enhance electrical safety by preventing dangerous shock hazards and reducing the risk of electrical fires.

United States market for Ground Fault Current Protection Devices is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
