The global Group B Streptococcus Detection and Analysis market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The scientific name of GBS is *Streptococcus agalactiae*, also known as group B *Streptococcus*. It normally lives in the vagina and rectum. It is an opportunistic pathogenic bacteria. Invasive infections are most common in neonates, the elderly, and those with predisposing factors (i.e., pregnancy, diabetes, and immunocompromise). Generally, GBS infection in normal healthy people does not cause illness. According to research, about 10% to 30% of pregnant women have GBS vaginally resident, and 40% to 70% of them will be passed to their newborns during delivery. If newborns carry GBS, about 1% to 3% will develop early invasive infection, of which 5% will lead to death. Infections in pregnant women manifest as bacteremia, urinary tract infection, fetal membrane infection, endometrial infection and wound infection.
