Growth disorder medications, also known as growth hormone (GH) therapy, are pharmaceutical drugs used to treat growth disorders in children and adults. Growth disorders are medical conditions characterized by abnormal or insufficient growth, which can result in short stature or other health problems. The most common growth disorder treated with medication is growth hormone deficiency (GHD), but these medications may also be used for other conditions such as Turner syndrome, chronic kidney disease, and idiopathic short stature.

The global pharmaceutical market is 1475 billion USD in 2022, growing at a CAGR of 5% during the next six years. The pharmaceutical market includes chemical drugs and biological drugs. For biologics is expected to 381 billion USD in 2022. In comparison, the chemical drug market is estimated to increase from 1005 billion in 2018 to 1094 billion U.S. dollars in 2022. The pharmaceutical market factors such as increasing demand for healthcare, technological advancements, and the rising prevalence of chronic diseases, increase in funding from private & government organizations for development of pharmaceutical manufacturing segments and rise in R&D activities for drugs.
