Guided Tissue and Bone Regeneration (GTR/GBR) membranes are specialized barriers used in dental and orthopedic procedures to facilitate the healing and regeneration of bone and soft tissues. These membranes are placed over bone defects or periodontal lesions to prevent the invasion of non-osteogenic tissues, thus creating a protected environment that allows bone and connective tissue cells to proliferate and repair the defect. Typically made from resorbable materials such as collagen, these membranes gradually degrade and are absorbed by the body, eliminating the need for a secondary surgical procedure for removal. GTR/GBR membranes play a critical role in improving the outcomes of procedures such as dental implants, periodontal surgeries, and bone grafts by ensuring proper tissue regeneration and integration.

The global Guided Tissue and Bone Regeneration Membranes market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
