The global Gypsum Board Recycling System market size is predicted to grow from US\$ 979 million in 2025 to US\$ 1847 million in 2032; it is expected to grow at a CAGR of 9.5% from 2026 to 2032.

In 2025, global sales of gypsum board recycling systems reached 100,000 units, with an average selling price of US\$10,000. A gypsum board recycling system is a device system used to recycle and reuse waste gypsum board. It is widely used in the construction industry to handle waste gypsum board generated during building demolition. This system uses mechanized processing technology to separate gypsum and paper from waste gypsum board, extracting recyclable materials and reprocessing them into new gypsum board or other building materials, reducing waste accumulation and environmental pollution. Upstream raw materials include gypsum powder, paper, and other building materials, while the downstream supply chain mainly consists of construction waste disposal companies, waste recycling enterprises, and gypsum board manufacturers. With the increasing emphasis on green building and resource recycling in the construction industry, the demand for gypsum board recycling systems has been growing year by year. Total production capacity is projected to be 150,000 units per year, with a gross profit margin of approximately 18%. Downstream consumption mainly comes from waste disposal in building demolition and renovation projects, while upstream material consumption is concentrated in the reprocessing of gypsum and paper. With the strengthening of waste disposal regulations and the rising demand for environmentally friendly building materials, the market prospects for gypsum board recycling systems are broad, especially in developing countries and regions with rapid urbanization, where there are huge business opportunities.

The gypsum board recycling system market is gradually growing with the strengthening

of global construction waste management and the development of the circular economy. As an important piece of equipment for the resource-based treatment of construction solid waste, this system is mainly used for crushing, separating, screening, and regenerating waste gypsum board, achieving efficient recycling and reuse of gypsum powder and paper fibers. With the increasing frequency of building demolition, interior renovation, and industrial building upgrades, a large amount of waste gypsum board is generated, leading to a continuous increase in the demand for efficient and environmentally friendly recycling, driving the industry's transformation from traditional landfill disposal to resource utilization.

From the perspective of market demand structure, construction demolition waste remains the largest source of application. The continuous increase in urban renewal, old building renovation, and infrastructure upgrade projects has kept the amount of waste gypsum board steadily increasing. At the same time, the residential decoration market and commercial building renovation projects also contribute a large amount of scattered waste, requiring centralized processing by specialized recycling systems. In addition, building material manufacturers are also beginning to establish closed-loop recycling systems, reusing recycled gypsum in the production of new building materials to reduce raw material costs and meet green building certification requirements.

From the perspective of technological development trends, gypsum board recycling systems are developing towards high-efficiency sorting, intelligentization, and low energy consumption. The integrated application of high-precision crushing, airflow separation, and mechanical screening technologies has continuously improved the purity of recycled gypsum powder. Simultaneously, the introduction of automated control systems and intelligent sensors helps enhance system operational stability and reduce manual operation costs. Furthermore, modular designs and mobile recycling equipment are emerging to adapt to the flexible processing needs of construction sites of varying sizes.

Overall, the gypsum board recycling system market represents a significant sub-segment within the construction solid waste resource utilization sector. Its growth is primarily driven by strengthened environmental policies, requirements for reducing construction waste, and the development of a circular economy. In the future, with the upgrading of green building standards and the advancement of carbon emission reduction targets in the construction industry, high-efficiency, low-energy-consumption, and high-recovery-rate resource utilization equipment will become the main development direction of the industry. Companies with solid waste treatment process capabilities, system integration capabilities, and environmental engineering experience

are expected to gain greater development space in future market competition.
