According to our LPI (LP Information) latest study, the global H Acid market size was valued at US\$ 622.5 million in 2023. With growing demand in downstream market, the H Acid is forecast to a readjusted size of US\$ 799 million by 2030 with a CAGR of 3.6% during review period.

The research report highlights the growth potential of the global H Acid market. H Acid are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of H Acid. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the H Acid market.

H acid, 1-amino-8-naphthol 3, 6-disulphonic acid, is a crystalline or paste, slightly soluble in cold water, soluble in alkaline solutions such as soda ash and caustic soda. It is a key intermediate in the production of reactive dyes. H acid is mainly used for the production of acid, direct and reactive dyes, such as acid fuchsin 6B, acid red G, acid black 10B, direct black, reactive brilliant red k-2bp, reactive purple k-3r, reactive soluble blue k-r and more than 90 kinds, these dyes are used for wool spinning, cotton fabric dyeing. H acid plays a key role in the production of reactive dyes. Under the influence of increasingly stringent environmental protection requirements in China, many H acid enterprises in China have stopped production or maintained low operating rate. The representative enterprises are chuyuan group and jihua group, which are the leading H acid enterprises in China and have been greatly impacted. On the other hand, it is also because of the backward domestic production technology. Catalytic hydrogenation is a continuous production process, and as a representative of advanced technology, its

sewage discharge is greatly reduced. The traditional process is intermittent iron powder reduction process, and the vast majority of H acid enterprises in China are still in use. However, to upgrade the process needs to invest a lot of money, which is also the current difficulties faced by enterprises. Currently, global H acid production bases are mainly concentrated in China and India, with an annual capacity of about 180,000 tons in China and 40,000 tons in India in 2018. The production areas of H acid in China are mainly hubei, jiangsu and shandong. India is mainly distributed in gujarat and maharashtra. Europe, America, Japan and South Korea have already shut down or shifted the industry. The whole dyestuffs industry in China is in the stage of industrial upgrading and industry reshuffle, a large number of small and medium-sized enterprises are gradually being eliminated, and the backward process is also being replaced by the new process, so this stage is likely to lead to a short period of market supply imbalance, and then cause the market price volatility. The H acid price in China reached a peak of 50 yuan/kg in 2014, and then gradually fell to 34 yuan/kg in 2018.

Global H Acid key players include Chuyuan Hi-Tech Group Co.,Ltd, Zhejiang Jihua Co.,Ltd, Kiri Industries Limited, etc.
