The global H-Shaped Silicon Carbide Rod market size is predicted to grow from US\$ 13.76 million in 2025 to US\$ 23.22 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

In 2025, global production of H-shaped silicon carbide rods reached 210,000 units, with an estimated average selling price of US\$67 per unit. H-type silicon carbide rods are a type of irregularly shaped non-metallic high-temperature electric heating element made primarily of high-purity silicon carbide through molding, high-temperature sintering or recrystallization, resistance sorting, end thickening, and metallization. Their structure typically consists of two or more heating sections connected by transverse joints to form an 'H' shape or multi-bridge structure, allowing for a larger heating area, better mechanical support, and more flexible wiring layout within a limited furnace space. They are mainly used in industrial electric furnaces where high heating speed, temperature uniformity, installation space, and service life are required. They are suitable for applications in glass, chemical, electronic materials, ceramic sintering, powder metallurgy, heat treatment, laboratory high-temperature furnaces, box furnaces, bogie hearth furnaces, roller kilns, and tunnel kilns. The upstream of the industry chain mainly includes green silicon carbide micro powder, petroleum coke, quartz sand/silicon sources, carbon materials, binders, metal spraying materials, ceramic insulating parts, and electrode clamps; the midstream includes silicon carbide rod forming, sintering, bridging, resistance matching, cold end treatment, quality inspection, and customized processing; the downstream includes industrial furnace manufacturers, ceramic and refractory material companies, glass and fiberglass companies, powder metallurgy companies, electronic ceramics and semiconductor material companies, and scientific research furnace plants. Gross profit margins range from approximately 20% to 35%.
