The global Hair Thinning Shear market size is predicted to grow from US\$ 361 million in 2025 to US\$ 548 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

Global sales of hair thinning shears reached 3.35 million units in 2025, with an average price of \$110 per unit.

Thinning scissors are a tool used for haircuts, also known as thinning shears or thinning shears. It usually has a specially designed blade that helps thin and reduce the density of the hair during the cutting process. These scissors usually have asymmetrical toothed blades that allow them to cut only part of the hair, thereby achieving a thinning effect, rather than completely cutting the hair.

Thinning scissors are designed to help achieve a more natural look, especially on thick or overly dense hair. It can help barbers adjust the thickness and shape of hair when cutting, making the hairstyle more three-dimensional and even. Thinning scissors are usually made of high-quality stainless steel or alloy steel, with precise cutting capabilities and comfortable handle designs to ensure precision and comfort during the hair cutting process.

The core materials of thinning shears include the blade material, the screw bearing system, and the handle material. Regarding blade materials, mainstream products use imported Japanese or Swedish stainless steel (such as VG-10, ATS-314, SUS440C), with a hardness of HRC 54-58 to ensure a sharp and durable cutting edge. High-end products use cobalt alloy steel or powder metallurgy steel (such as SG2, ZDP-189) to improve wear resistance. Tooth processing requires CNC milling, laser cutting, or wire cutting; the tooth shape design (V-shaped, U-shaped, herringbone-shaped) directly affects the hair removal ratio (15%-50%) and the smoothness of shearing. The screw

bearing system mostly uses imported Japanese ball bearing screws (such as Toba and Fuji brands) to ensure smooth opening and closing without wobbling. Handle materials are mainly medical-grade silicone, ABS engineering plastic, or forged steel; ergonomic design affects fatigue during prolonged use.

In terms of cost structure, imported blade materials account for 35%-50% of the total cost, with Japanese Takefu Special Steel VG-10 costing approximately 3-5 times more than domestically produced ordinary stainless steel; CNC precision machining and tooth grinding account for 25%-35% of the cost, and a single pair of thinning shears requires 20-30 grinding processes, making manual fine grinding of the blade significantly more expensive than mass-produced machine work; imported bearings, screws, and accessories account for 10%-15%, while domestic alternatives can reduce costs by 30% but are slightly less durable; handle rubber coating and surface treatment account for 5%-10%.
