Halide minerals are those minerals which include a dominant halide anion such as fluorine (F), chlorine (Cl), bromine (Br) and Iodine (I). These minerals are complex in nature and have polyatomic anions. Most of the halide minerals occur in deposits of marine evaporite.

Halite is an important source of sodium chloride, in parallel with NaCl extracted from brine wells or sea water. Sylvite is potassium chloride in its natural mineral form, while fluorite is a vital source of hydrogen fluoride, obtained as a byproduct of the manufacturing of fertilizers. These minerals are used for a wide range of applications such as fertilizers, pharmaceuticals, food ingredients, water softening and other industrial applications.
