Halloysite is a silicate mineral, which is a bit like kaolinite. There are two forms, one is similar to kaolin and the other is hydrate. It is said to be hydrated because it contains water in its crystals, so it is also known as kaolinite. A certain mineral contains water, which is not the water content that is understood in daily life.

Halloysite clay is fine and has low impurities. It is mainly used for the production of high-grade ceramics, electric porcelain, crucibles and refractory materials. The water content mentioned here refers to a fixed amount (no more or less) of water molecules combined with other molecules to form a substance. Such a substance is also called hydrate. Many such hydrates lose their internal water molecules after heating and become a new substance. If the hydrated halloysite is heated to 50-90 ° C, it becomes transformed halloysite.
