## Abstracts

The global Haloalkane market size is predicted to grow from US\$ 29635 million in 2025 to US\$ 41858 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

Haloalkanes are a class of organic compounds in which one or more hydrogen atoms in an alkane are replaced by halogen atoms such as fluorine, chlorine, bromine, or iodine, giving the general formula  $R^?X$  (where R is an alkyl group and X is a halogen); they are key intermediates in organic synthesis and are widely used in solvents, refrigerants, agrochemicals, pharmaceuticals, and polymer production. The supply chain of haloalkanes is highly integrated with the petrochemical and halogen industries: upstream, feedstocks such as methane, ethane, propane, or higher hydrocarbons are sourced from natural gas or crude oil refining, while halogens (Cl?, Br?, F?) are produced via processes like chlor-alkali electrolysis or fluorite-based chemistry; midstream, haloalkanes are manufactured through halogenation reactions (e.g., free-radical chlorination, electrophilic addition, or fluorination) in large-scale chemical plants, followed by purification and stabilization; downstream, they are formulated or further reacted into higher-value products such as PVC (via vinyl chloride), refrigerants (HFCs/HFOs), solvents, flame retardants, and fine chemical intermediates, and then distributed to industries including construction, automotive, electronics, agriculture, and pharmaceuticals. In 2025, global Haloalkane output was about 31 million tons with 48 million tons of capacity, average prices of USD 900?1,500 per ton, and gross margins around 19%.

United States market for Haloalkane is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
