The global Halogen Flame Retardants market size is predicted to grow from US\$ 5340 million in 2025 to US\$ 6380 million in 2031; it is expected to grow at a CAGR of 3.0% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Halogen flame retardants are a class of flame-retardant chemicals that use halogen elements—primarily bromine and chlorine—as active components. They were among the earliest flame retardants to be widely used. Brominated flame retardants are known for their high efficiency, low loading requirements, and minimal impact on the mechanical properties of base materials. Their flame-retardant mechanism involves the release of halogenated gases such as hydrogen bromide during combustion, which capture free radicals and interrupt the chain reactions of fire propagation. Common examples include decabromodiphenyl ether (decomposition temperature ? 300°C) and tetrabromobisphenol A (decomposition temperature ? 240°C). Chlorinated flame retardants operate via a similar mechanism but are generally less efficient, though more cost-effective, making them suitable for low-spec applications. However, due to concerns over the release of toxic and corrosive gases during combustion, and increasing environmental regulations, the use of halogenated flame retardants has become increasingly restricted.

United States market for Halogen Flame Retardants is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Halogen Flame Retardants is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.

Europe market for Halogen Flame Retardants is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
