A halogen heater is device that produces heat by using halogens, when plugged into an electric current. Unlike other electrical devices that produce heat through coils and heat conductors, these heaters use halogen elements enclosed in lamps or bulbs to provide a direct source of radiant heat or energy

Halogen heaters are mainly of two types: Oscillating heaters, which have a fan that propels air within the heating system, enabling it to get heated and finally blowing it out of the system. The other type uses blowers that expel heated air from the system. Halogen heaters come in different sizes and shapes depending on their functions.
