Abstracts

The global Halogen Lamp Heater market size is predicted to grow from US\$ 338 million in 2025 to US\$ 460 million in 2032; it is expected to grow at a CAGR of 4.6% from 2026 to 2032.

Halogen Lamp Heater is a device that uses tungsten filaments in a quartz glass tube filled with halogen elements or halides to generate light and heat. Through the halogen-tungsten cycle principle, the sublimated tungsten combines with halogen gas at high temperature to form tungsten halides. After thermal decomposition, tungsten is redeposited on the surface of the filament, which not only prevents the glass shell from blackening but also prolongs the life of the filament. At the same time, it has high radiation density, fast response and precise temperature control characteristics. By adjusting the power, voltage and surface temperature, it can meet the radiation heating needs of home and commercial heating, industrial coating curing, plastic thermoforming, and scenes.

Halogen Lamp Heater Industry Development Trends

In processes such as semiconductor manufacturing that require high-intensity, wide-spectrum lighting, halogen lamp heaters still occupy a certain market share due to their cost-effectiveness and technological maturity. Especially in lithography, inspection, metrology and other links, the stability and compatibility of halogen lamps make them the first choice.

Halogen Lamp Heater Industry Development Driving Factors

Compared with laser or dedicated LED systems, halogen lamp heaters have a lower

initial purchase cost. For application scenarios that do not require precise spectral control or extreme light output, halogen lamps remain a cost-effective choice.

Hindering Factors for the Development of the Halogen Lamp Heater Industry

As market demand declines, the supply of professional halogen lamp suppliers may decrease, leading to challenges in procurement, maintenance and spare parts supply. This increases operational risks for specific equipment and applications that rely on halogen lamp heaters.
