## Abstracts

The global Halogenated Flame Retardant PBT market size is predicted to grow from US\$ 399 million in 2025 to US\$ 476 million in 2032; it is expected to grow at a CAGR of 2.6% from 2026 to 2032.

Halogenated Flame Retardant PBT refers to Polybutylene Terephthalate, a high-performance engineering thermoplastic, that has been modified with flame retardant additives containing halogen elements. Halogenated flame retardants, typically incorporating bromine or chlorine, are known for their effectiveness in suppressing combustion and improving the fire resistance of polymers. However, there are environmental and health concerns associated with the use of halogenated flame retardants, particularly due to the release of toxic by-products during combustion. It's important to note that there is an ongoing shift towards halogen-free alternatives in various industries.

**Historical Use in Various Industries:** Halogenated flame retardants, including those used in PBT, have historically been widely used in industries such as electronics, automotive, and construction where fire safety standards are high.

**Environmental and Health Concerns:** There is a growing awareness of environmental and health concerns associated with the use of halogenated flame retardants. The release of toxic by-products during combustion has led to increased scrutiny and regulatory pressure to find more environmentally friendly alternatives.

**Shift Towards Halogen-Free Alternatives:** Many industries are actively seeking halogen-free flame retardant alternatives due to the environmental and health considerations associated with halogenated flame retardants.

Research and Development: Ongoing research and development efforts are focused on developing new flame retardant formulations that maintain effectiveness while addressing environmental and health concerns.
