High-efficiency haloxyfop EC is a post-emergence selective herbicide. After treatment, the stems and leaves can be quickly absorbed by the leaves of gramineous grasses, and then spread to the whole plant to inhibit the plant meristem. The pesticide sprayed into the soil is easily absorbed by the roots and can also play a herbicidal role. The average half-life in the soil is 55 days. The drug effect is stable, less affected by adverse environmental conditions such as low temperature and rain. Rainfall one hour after the drug had little effect on the efficacy of the drug. Not effective against broadleaf grasses

and sedges.
