Handheld digital radiography devices are small or micro X-ray machines that perform imaging based on X-ray principles. They are mainly used for non-destructive testing and rapid safety inspections in the medical field and can be easily carried and used. The working principle is based on the penetrability and reflection principles of X-rays. The X-ray source produces high-energy X-rays, which penetrate the object and are reflected to the detector. The detector converts the received signal into an electrical signal, which is then processed by a data processor. Processing and finally displaying the X-ray image of the object on the monitor.

The global Handheld Digital Radiography Device market size is projected to grow from US\$ 130 million in 2024 to US\$ 232 million in 2030; it is expected to grow at a CAGR of 10.2% from 2024 to 2030.
