A handheld fiber inspection probe is a portable and compact device used in fiber optic network installations, maintenance, and troubleshooting to inspect the quality and cleanliness of optical fiber connectors and their end faces. This tool allows technicians to visually assess the condition of the connectors, ensuring that they are free from contaminants, scratches, or other defects that could degrade optical performance.

Handheld fiber inspection probes are designed to be lightweight, compact, and easy to carry, making them ideal for field use and on-the-go inspections. The probe contains a built-in microscopic camera or lens system, enabling technicians to magnify and closely examine the fiber end face for any contamination, defects, or damage. The probe

features a display screen that allows technicians to view live images of the fiber end face being inspected. This screen enables real-time assessment of the connector's condition.

Fiber cable testing happens at various points during the life of a fiber network to help ensure proper performance: before and after installation, as well as before and after changing, upgrading, or adding equipment.

Some of the most common causes of fiber optic malfunctions, such as excessive bending along the cable, faulty or damaged connectors, and contamination of end face connections, may happen at any time, and testing tracks them down and helps resolve them. Knowing the right tests to perform and having the right tools to use is key to keeping your fiber networks up and running.
