The global Handheld Imaging System market size is predicted to grow from US\$ 795 million in 2025 to US\$ 1348 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

In 2025, global handheld imaging system production reached approximately 148 k units, the average price is 5500 usd/unit. Handheld imaging system is a portable electronic device designed for medical diagnosis and monitoring. It integrates image acquisition, processing and display functions, allowing medical staff to operate handheld and obtain visual medical images of patient body parts in real time. Such systems usually include dedicated probes or sensors, image processing units, display screens and batteries. Their core features are light and flexible, simple to operate and capable of real-time bedside imaging. They are widely used in clinical examination, surgical navigation, wound evaluation, primary medical care and remote consultation to help doctors make rapid, non-invasive or minimally invasive diagnosis and evaluation.

Market Concentration and Key Players:

Internationally, handheld imaging systems have a high degree of market concentration, mainly concentrated in developed countries such as Europe, America and Japan. For example, large manufacturers such as GE and Philips; domestically, handheld imaging systems still have a lot of room for development.

Manufacturing Processes and **Market Trends**:

Microminiaturization and high integration are the core of the manufacturing process of handheld imaging systems. MEMS technology is widely used in ultrasonic equipment to

manufacture transducers, such as capacitive micromechanical ultrasonic transducers or piezoelectric micromechanical ultrasonic transducers. Its manufacture involves semiconductor micro and nano processing technology, such as SOI substrate, photolithography mask and gold bump bonding technology. There are also studies to manufacture PMUT arrays using phosphosilicate glass sacrificial layer technology. For multimode systems such as photoacoustic ultrasonic, The probe manufacturing involves precise steps such as laminating transparent piezoelectric materials, curing and acoustic lens casting, while handheld optical coherence tomography or fundus cameras rely on complex optical system integration, including the precise assembly of galvanometer modules, achromatic lens groups and flip mirror structures. The overall system assembly also needs to solve problems such as heat dissipation management and sealing, such as using heat pipes or graphene thermal conductive materials.

Market trends show continued rapid growth in this segment, driven by rising demand for instant diagnostics, sinking medical resources, aging populations and chronic disease management, with technology developments focusing on wireless connectivity, AI algorithm integration and improved image quality to make devices more portable and intelligent and support telemedicine.
