The global Handheld Nuclide Recognition Instrument market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The handheld nuclide recognition instrument is a portable device used for detecting and identifying radioactive substances. It is usually used in areas where there may be a risk of exposure to ionizing radiation, such as nuclear power plants, hospitals, and laboratories. The working principle of this device is to measure the energy and radiation type emitted by the radiation source, and compare it with a known radioactive isotope database. This enables the device to identify specific isotopes present in the sample. Emergency personnel, first responders, and hazardous materials teams often use handheld nuclide recognition instruments to quickly assess the potential hazards caused by radioactive sources. They can also be used for environmental monitoring, nuclear waste management, and nuclear safety applications.

United States market for Handheld Nuclide Recognition Instrument is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Handheld Nuclide Recognition Instrument is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
