A handheld tire tread depth scanner is a portable electronic inspection device used to quickly and accurately measure the remaining depth of a tire's tread groove. It uses laser scanning, structured light, or ultrasonic sensing technology to non-contactly acquire three-dimensional tread topography data. A built-in processor automatically calculates and displays minimum and average depth values. Select models support wireless transmission to a mobile phone or management platform. This instrument is widely used by auto repair shops, fleet management, security agencies, and tire manufacturers to assess tire wear and determine whether it has reached the legal safety limit (typically 1.6mm), improving inspection efficiency and accuracy and ensuring driving safety.In 2024, the global production of handheld tire tread depth scanners will reach 143,270 units, with an average selling price of US$520 per unit, a single-line production capacity of 5,000 units, and a gross profit margin of 32%.
