Handheld Ultrasonic Thickness Gauge is a portable device that uses ultrasonic technology to achieve non-destructive measurement of object thickness. It transmits ultrasonic pulses and receives and analyzes the echo signals to calculate material thickness without destroying the sample.

The device transmits ultrasonic pulses to the object to be measured through a probe or sensor. These ultrasonic waves travel inside the object, interact with interfaces, and some are reflected back. The device receives the reflected ultrasonic signals and then

analyzes the characteristics of these signals, such as travel time and amplitude. From the characteristics of the signal, the thickness of the material can be calculated.
