Haptic feedback motors are specialized motors used in electronic devices to provide tactile feedback or physical sensations to the user. They are designed to simulate the sense of touch by generating vibrations or other mechanical forces that the user can feel. This feedback is commonly used in devices such as smartphones, game controllers, wearables, and medical devices, enhancing the user's experience by making interactions more immersive and intuitive.Haptic feedback motors work by converting electrical signals into mechanical vibrations or movements, which are then perceived as 'touch' sensations when the motor is engaged. These motors are commonly small in size, high-performance, and capable of providing different intensities and patterns of feedback.
