A haptic motor controller is an electronic device that manages and drives haptic motors—typically vibration motors like eccentric rotating mass (ERM) or linear resonant actuators (LRA)—to produce tactile feedback in devices such as smartphones, game controllers, and wearables. It interprets digital signals from a processor and converts them into precise motor actuation patterns, enabling various vibration effects like clicks, pulses, or textures. These controllers enhance user interaction by providing physical sensations that simulate real-world touch responses, improving usability and immersive experiences in electronic devices.
