Harbour and channel dredging is a type of dredging that involves the removal of sediments and debris from the bottom of harbours and channels to maintain or increase their depth, width, and navigability. Harbour and channel dredging is essential for the safe passage of ships and boats, as well as for the protection and enhancement of the coastal environment. Harbour and channel dredging can be performed using various methods and equipment, such as cutter suction dredgers, trailing suction hopper dredgers, backhoe dredgers, grab dredgers, bucket ladder dredgers, water injection dredgers, and bed levellers.

The growth of the market is driven by factors such as the increasing demand for maritime trade and transportation, the expansion and development of ports and

harbours, the need for coastal protection and restoration, and the rising awareness about environmental sustainability. Some of the challenges faced by the market are the high costs and risks involved in harbour and channel dredging projects, the regulatory and social constraints on the disposal of dredged material, and the impact of climate change and natural disasters on the coastal areas.
