The global Hard Carbon Anode market size is predicted to grow from US\$ 6008 million in 2025 to US\$ 9282 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

Hard carbon, also known as "non-graphitizable carbon", is usually a general term for carbon materials that are difficult to be graphitized. Hard carbon is formed by stacking twisted graphene sheets. Even at temperatures higher than 3000°C, it is difficult for these stacked graphene sheets to completely unfold or flatten to further form graphite. The applications of hard carbon materials in the energy field mainly include lithium-ion batteries, supercapacitors and sodium-ion batteries.

Hard carbon anode materials are mainly used in the fields of energy storage and electric two-wheeled vehicles. They will also be heavily invested in passenger vehicles in 2025, and the demand is expected to increase in 2027. Hard carbon materials are the preferred negative electrode materials for sodium-ion batteries, and their demand is on the rise along with the demand for sodium-ion batteries.
