Hard drive low-level software usually refers to a software tool used to erase data on a hard drive and reinitialize the hard drive. It works like restoring a hard drive to its factory settings while completely erasing all data stored on the hard drive, including the operating system, applications, files, and file systems. This software tool is often used for data security needs, such as the complete erasure of data on a hard drive before it is recycled, sold, or donated to prevent the disclosure of personal or confidential information. Generally speaking, it will use some special algorithms to perform multiple overwrite operations on the hard disk to ensure that the data is effectively erased, and it can also reinitialize the hard disk to make it available again. Hard drive low-level software is usually developed by third-party vendors and is available on the market in various forms, either free, commercial or as a service. Caution is required when using this software, as once the erasure is complete, the data cannot be recovered, and improper operation may result in hard drive damage or data loss.

The global Hard Drive Low Format Software market size is projected to grow from US\$ 357 million in 2024 to US\$ 483 million in 2030; it is expected to grow at a CAGR of 5.2% from 2024 to 2030.
