Secure Flash Drive (also known as Encrypted Flash Drive) can be used in finance, government/military, enterprises and individual in meeting tough data security. The purpose behind encrypted USB flash drives is to ensure a secure transfer of data. The encrypted drive can also protect against certain types of attacks, like cold boot attacks or malware. However, no device is 100% secure.

While the best flash drives bill themselves as tamper-proof, it is still possible for the device to be opened and the chip removed or damaged so the device no longer encrypts data. The SecureDrive line of products counteracts this by covering the important components in a hard epoxy coating. The encryption itself could present a problem if the standard is out of date or weak. The Advanced Encryption Standard (AES) is the one used by the U.S. government and one of the most trusted for these devices.

Keeping data secure is more important than ever, with data privacy regulations becoming standard globally. If you must use a USB flash drive to transmit or store data, a hardware-encrypted system is your safest – and easiest – option. This report studies the Hardware Encrypted Flash Drives market.
