The global Hastelloy Sintered Mesh market size is predicted to grow from US$ 526 million in 2025 to US$ 751 million in 2031; it is expected to grow at a CAGR of 6.1% from 2025 to 2031.

Hastelloy Sintered Mesh is a newly developed stainless-steel material in recent years. The corrosion resistance of this material is higher than that of 304 and 316 materials. In industries with high corrosion resistance such as pharmacy, the requirements for this filter mesh and filter disc are higher.

Hastelloy Sintered Mesh refers to a type of mesh material that is made from Hastelloy alloy. Hastelloy is a family of corrosion-resistant alloys that are known for their excellent resistance to corrosion, high temperature, and mechanical strength. It consists primarily of nickel, chromium, and molybdenum, with additional elements such as tungsten and cobalt.

The sintering process involves compacting metal powders and heating them to a temperature below the melting point. The particles bond together, forming a solid structure with interconnected pores. This results in a mesh material with a high degree of porosity and uniform pore size distribution.

Hastelloy sintered mesh offers several advantages due to its unique properties. It has exceptional resistance to a wide range of corrosive environments, including acids, chlorides, and oxidizing media. It can withstand high temperatures and pressure conditions without significant degradation. The sintered mesh structure provides
