Abstracts

The global HBM TCB Bonder market size is predicted to grow from US$ 382 million in 2025 to US$ 1061 million in 2032; it is expected to grow at a CAGR of 13.0% from 2026 to 2032.

HBM TCM (thermo-compression bonders) are high-precision semiconductor assembly systems designed to construct three-dimensional high-bandwidth-memory stacks by picking, aligning and bonding TSV-enabled DRAM dies onto a wafer, substrate or partially completed memory stack. A production system typically combines high-resolution optical alignment, precision die handling, controlled heating of the die and carrier, programmable bond force, active tip-and-tilt or coplanarity correction, warpage management, controlled-atmosphere processing and in-line process monitoring. The equipment forms reliable mechanical and electrical interconnections by applying a defined combination of temperature, pressure and time to fine-pitch microbumps, copper pillars or direct-metal interfaces. Commercial configurations include fully automated chip-to-wafer or die-to-wafer systems for high-volume manufacturing, chip-to-substrate platforms used in selected stack and package flows, and automated or semi-automated systems for process qualification and pilot production. The equipment supports process families such as TC-NCF, TC-NCP, MR-MUF-compatible stack-and-tack flows, flux-assisted bonding and fluxless bonding using reducing atmospheres, plasma treatment or active oxide reduction. Its principal applications are HBM3E, HBM4, HBM4E and higher-layer-count memory products, including 8-high, 12-high and 16-high stacks used alongside AI accelerators and high-performance-computing processors.

HBM thermo-compression bonding (TCB) is not simply a premium extension of conventional die attach. It is a specialized capital-equipment segment created by the simultaneous tightening of alignment, package-height, die-thickness, microbump-pitch, warpage and yield requirements in vertically stacked memory. A production tool must

preserve placement accuracy and coplanarity under meaningful thermal and mechanical loads while operating within a narrow material and process window defined by NCF, NCP, MR-MUF-compatible stack-and-tack or fluxless bonding flows. Demand during 2026–2028 is supported by the transition from HBM3E to HBM4 and HBM4E, increased adoption of 12-high and 16-high stacks, capacity additions by the leading memory manufacturers and the need to replace or upgrade tools that cannot meet the tighter process windows of the new generation. Official HBM4 production announcements from SK hynix and Samsung Electronics, together with SEMI's stronger outlook for DRAM and back-end equipment, support a relatively strong near-term capital-spending cycle.

The supply structure is substantially narrower than a simple count of companies advertising flip-chip or thermocompression capability would suggest. The key manufacturers of HBM TCB bonder include Hanmi Semiconductor, ASMPT, K&S, SEMES, Shinkawa and Besi, etc. South Korea currently has the strongest concentration of production-validated HBM suppliers, Japan retains deep precision-mechatronics and customer-engineering capabilities, and Singapore-headquartered groups provide broader global advanced-packaging platforms. China has developed the largest pool of new and prospective entrants, including suppliers with official HBM or CoWoS-oriented products and others with C2W, D2W or fluxless TCB platforms. However, public evidence of recurring orders, installed base and stable HBM production yield remains limited for most Chinese entrants. Consequently, these companies are retained for completeness but are not assigned revenue in the conservative 2025 base model unless shipment evidence is sufficiently strong.

Technology competition will increasingly focus on production economics and process-window control rather than on static placement-accuracy specifications alone. Higher stacks and thinner dies increase the importance of active tip-and-tilt correction, local warpage compensation, low-damage handling, rapid but uniform thermal cycling, precise force control and integrated post-bond inspection. Fluxless processing using formic-acid or other reducing atmospheres, plasma treatment and active oxide reduction can reduce residue and cleaning complexity while improving compatibility with tighter-pitch structures. ASMPT has publicly demonstrated a fluxless AOR route for 16-high HBM stacks, SEMES is developing next-generation hybrid-bonding capability alongside its production HBM TCB platform, and K&S has expanded its high-performance-memory product portfolio. These developments indicate that leading suppliers are preparing for a gradual technology transition rather than treating TCB and hybrid bonding as mutually exclusive near-term markets. Our base case therefore assumes strong TCB growth through 2028, followed by slower expansion as hybrid bonding

begins to penetrate the most demanding ultra-fine-pitch and very-high-stack applications around 2029 and beyond. TCB should nevertheless retain a substantial role because it benefits from an established material ecosystem, proven throughput, lower process complexity and a large installed base.

Report Scope

LP Information, Inc. (LPI) ' newest research report, the “HBM TCB Bonder Industry Forecast” looks at past sales and reviews total world HBM TCB Bonder sales in 2025, providing a comprehensive analysis by region and market sector of projected HBM TCB Bonder sales for 2026 through 2032. With HBM TCB Bonder sales broken down by region, market sector and sub-sector, this report provides a detailed analysis in US$ millions of the world HBM TCB Bonder industry.

This Insight Report provides a comprehensive analysis of the global HBM TCB Bonder landscape and highlights key trends related to product segmentation, company formation, revenue, and market share, latest development, and M&A activity. This report also analyzes the strategies of leading global companies with a focus on HBM TCB Bonder portfolios and capabilities, market entry strategies, market positions, and geographic footprints, to better understand these firms’ unique position in an accelerating global HBM TCB Bonder market.

This Insight Report evaluates the key market trends, drivers, and affecting factors shaping the global outlook for HBM TCB Bonder and breaks down the forecast by Primary Bonding Format, by Underfill and Stacking Route, geography, and market size to highlight emerging pockets of opportunity. With a transparent methodology based on hundreds of bottom-up qualitative and quantitative market inputs, this study forecast offers a highly nuanced view of the current state and future trajectory in the global HBM TCB Bonder.

This report presents a comprehensive overview, market shares, and growth opportunities of HBM TCB Bonder market by product type, application, key manufacturers and key regions and countries.
