The report requires updating with new data and is sent in 48 hours after order is placed.

The global HD Surround Sound Processors market size is predicted to grow from US\$ 228 million in 2025 to US\$ 339 million in 2031; it is expected to grow at a CAGR of 6.8% from 2025 to 2031.

Surround sound processors are the brains of all mid to high end home theater systems. They are similar to AV receivers in that they provide source switching and decoding, audio/video processing and volume control for various surround sound formats. But unlike an AV receiver, a preamp/AV processor has no built-in amplification and is dedicated to serving as the 'brain' of the system. This means they generally have more processing power available. Includes additional channels, flexible adjustment and calibration options. They also cost more because higher quality components must be included to improve performance.

All the inputs such as the gaming console, Blu-ray player, and Dish TV are connected to the processor. The processor is continuously fed with signals by these devices. The processor's job is to work on these signals and deliver them to their destinations.

These signals are digital and the processor converts these signals to analog means to convert them to electric charges. These analog signals can be given the shape of object-based audio such as Dolby Atmos or to CD version sound of surround sound.
